

— INVESTOR DECK

OXAR.

Sovereign bonds from emerging markets, on Solana. Daily yield, instant liquidity, no gatekeepers.

How real-world yield comes on- chain.

— THE PROBLEM

SOVEREIGN DEBT IS LOCKED AWAY.

Emerging-market government bonds yield 4–18%. They sit on the balance sheet of a handful of pension funds and primary dealers — behind a \$250k minimum, a wire form, and a country you'd need to fly to. Retail can't touch them. DeFi can't touch them. We can.

MARKET OPPORTUNITY

2 of 100 EM retail investors can buy local bonds.

The other 98 hold cash, FX, or pay 3–5% to a mutual fund wrapping the same instrument.

UNDERBANKED

1.4B adults in emerging markets have no investment account at all.

OXAR · Investor Deck

INFLATION HEDGE

Local-currency yields routinely beat double-digit inflation by 200–400 bps.

RWA WAVE

\$12B of U.S. treasuries are on-chain. EM debt is the next frontier.

— OPPORTUNITY SIZING

A \$1.3 trillion market is waiting for rails.

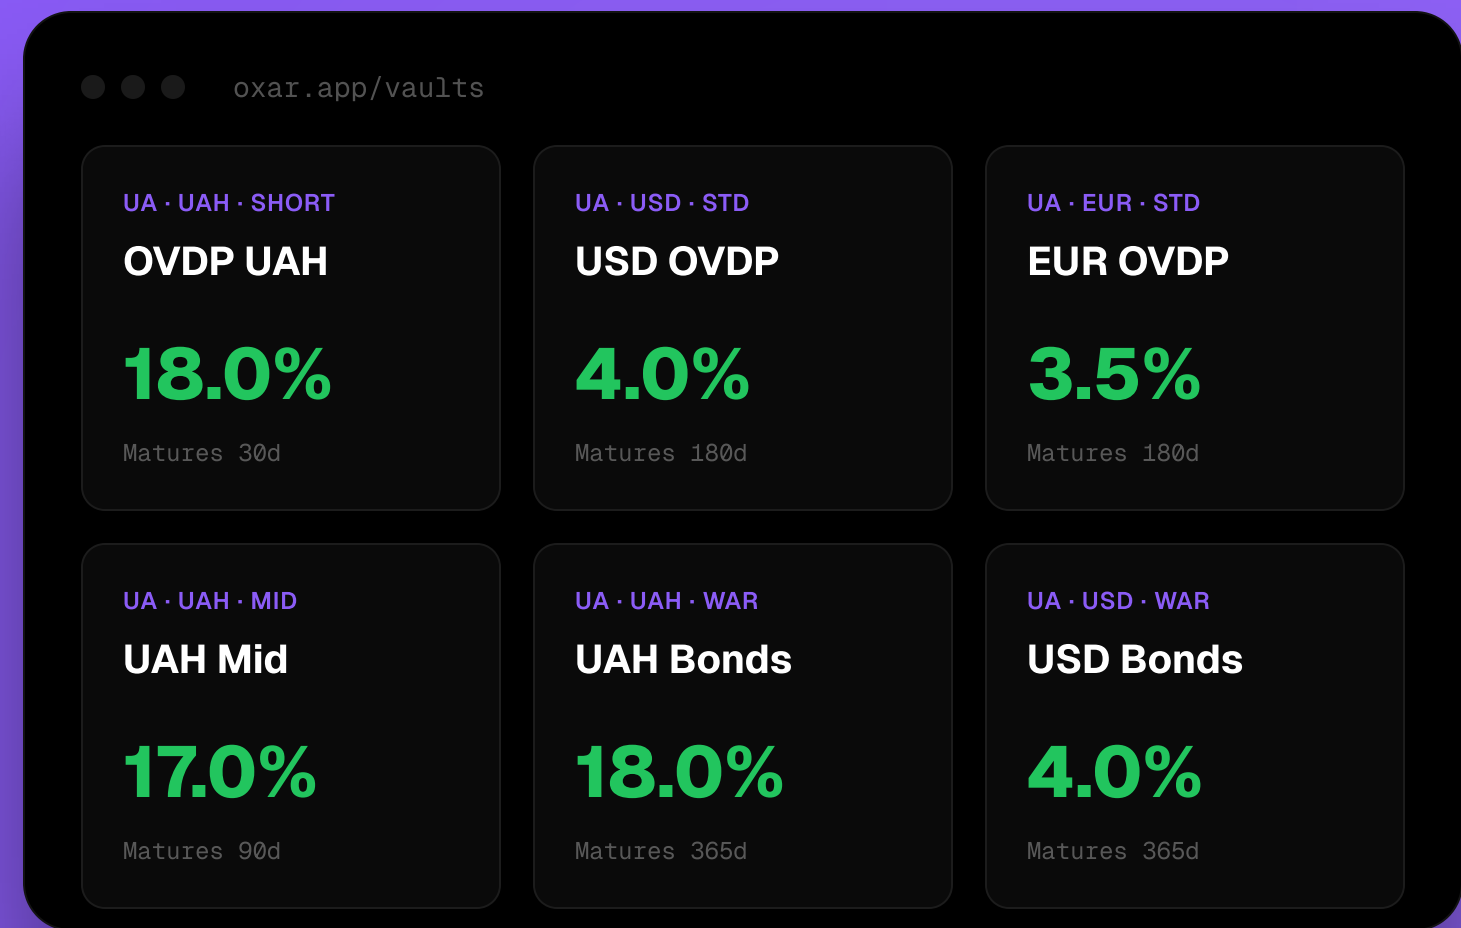

EM sovereign debt is bigger than the entire crypto market by 4×. Capturing 0.1% gets us to a \$1.3B vault TVL.

TAM	Total emerging-market sovereign debt outstanding	\$1.3T
SAM	Tokenizable, retail-accessible portion (≤ 24m maturity, USD/EUR settled)	\$420B
SOM	Realistic 5-year capture across UA, BR, ID, NG, TR	\$2.1B

Real bonds. On-chain wrappers. Daily yield.

OXAR turns each sovereign bond into a Solana vault. Buy with USDC, hold the token, watch NAV accrue every block. Sell on the secondary marketplace at any time — no bank, no broker, no minimum.

06 / 15 · OXAR · Solution

Four surfaces, one protocol.

V

Vaults

Six live vaults wrapping Ukrainian sovereign bonds across UAH, USD, EUR. Daily NAV accrual on-chain. Deposit USDC, receive vault token.

S

Swap

One-click USDC → vault token, with route selection and live rate. Embedded Privy wallet — no extension required.

M

Marketplace

Secondary market for vault tokens before maturity. Set your price, escrow PDA holds the asset, anyone can buy.

P

Portfolio

Live positions, accrued yield, maturity schedule, claim flow. One screen for the entire bond ladder.

— HOW IT WORKS

Underlying magic.

Every dollar of TVL is backed 1:1 by an off-chain custodian holding the real bond. The protocol just makes the wrapper composable, transferable, and instant-settlement.

CORE

PDA Vaults
One Solana program, deterministic vaults per bond series. Audited bytecode, no admin upgrades.

YIELD

Daily NAV Accrual
NAV ticks every slot. No rebases, no claim transactions until maturity.

SETTLEMENT

USDC In, USDC Out
Off-chain custody mints the bond, on-chain settlement uses Circle USDC for liquidity.

COMPLIANCE

TransferHook + KYC
Token-2022 hook enforces 40-day Reg S lockup and allowlist for U.S. persons.

— BUSINESS MODEL

Three lines, all on-chain.

RECURRING

Management Fee

Protocol takes a thin slice of NAV per year, streamed continuously to the treasury PDA.

0.50%

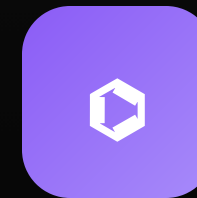

PER TRANSACTION

Mint & Redeem Spread

Small spread between custodian price and on-chain quote. Aligned with TVL, not user count.

0.20%

MARKETPLACE

Secondary Fee

Take rate on every secondary trade between users. Pure software margin.

0.30%

— TRACTION

Live on devnet. Audit ready.

Six vaults deployed, full deposit + claim + marketplace cycle working end-to-end. Privy embedded wallets remove the seed-phrase wall. Mainnet pencilled for Q3.

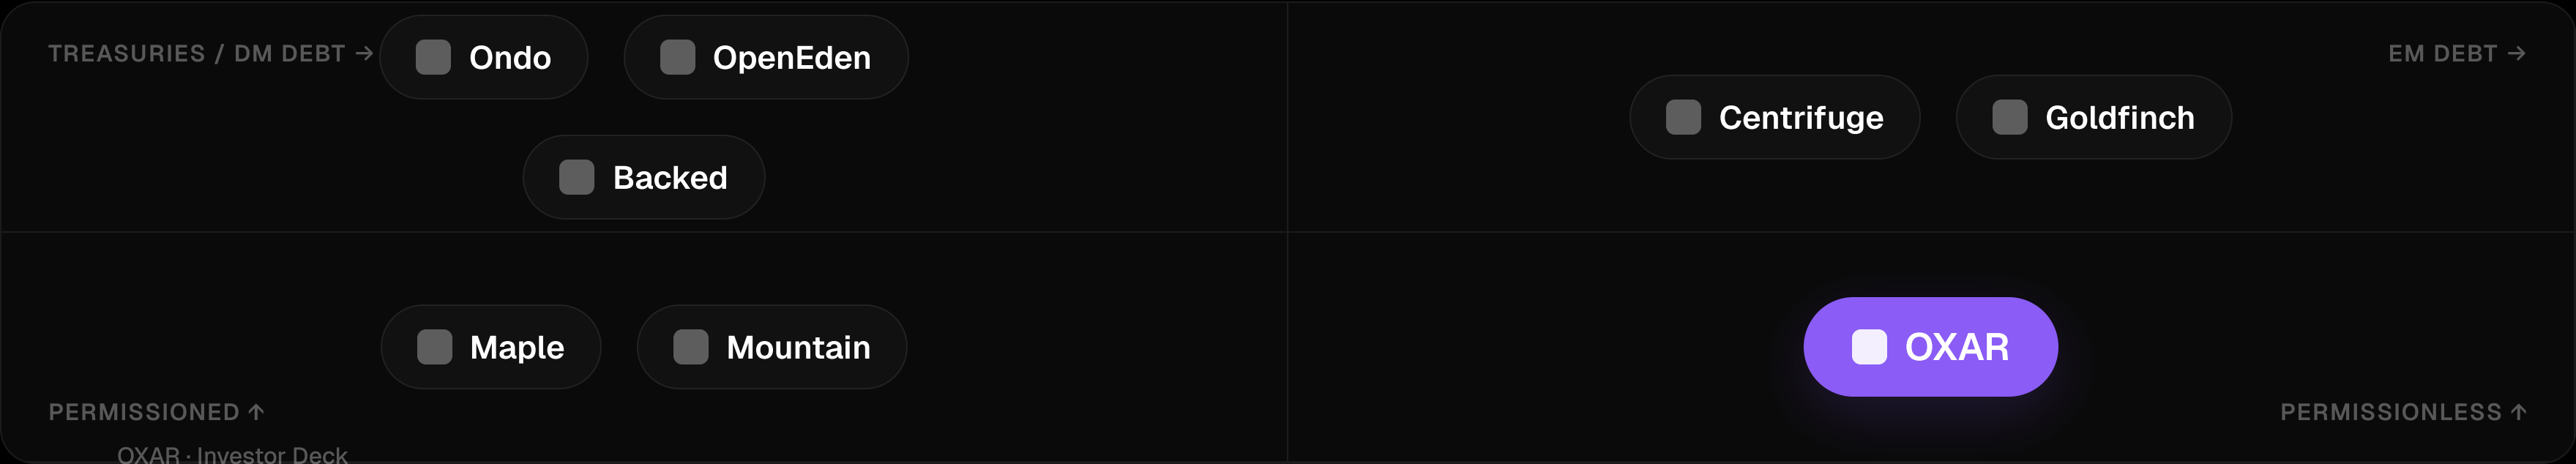

6/6

Vaults live on devnet, full life-cycle tested.

1,200+

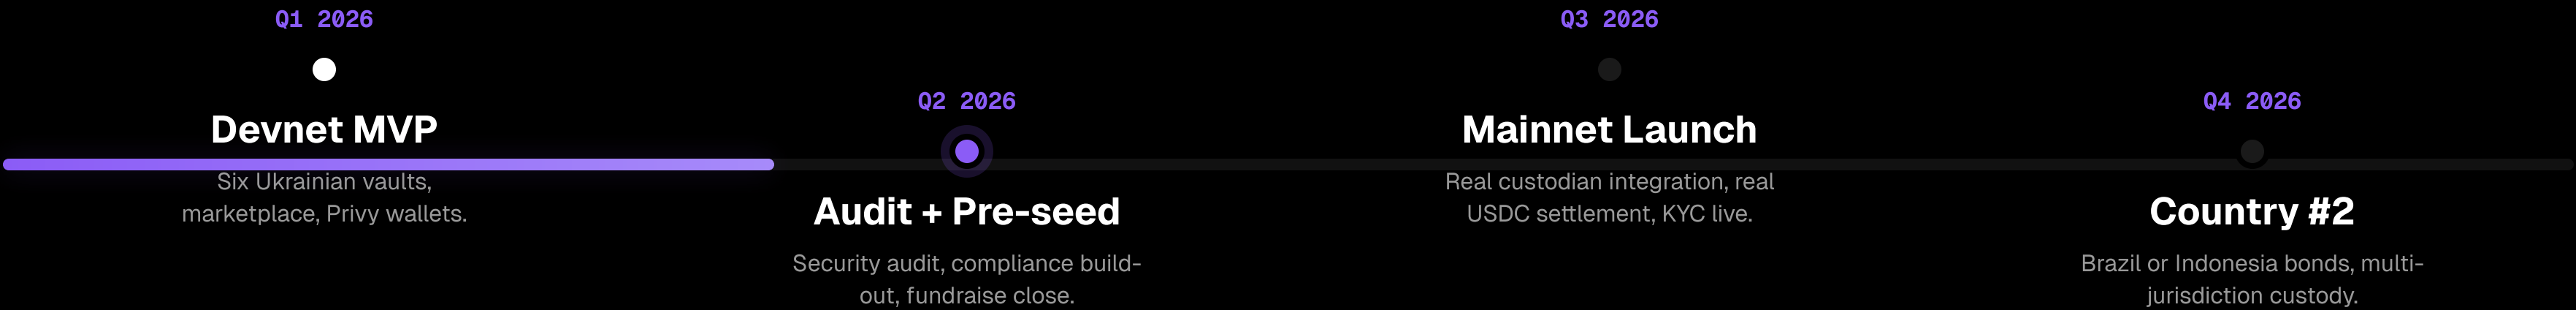

Early-access waitlist signups since open. Cert NFT for first 1,000.

Nobody is doing this. Yet.

ROADMAP

From devnet to multi-country in 12 months.

Founders.

DL

CEO · FOUNDER

Daniil Logachev

Built protocols and wallets in the ETNY ecosystem. Shipped OXAR MVP solo in 8 weeks.

+

CTO · OPEN

Hiring

Solana / Anchor lead. Will own contracts, audit response, and protocol upgrades.

+

ADVISORS

In progress

Sovereign-debt desk veteran + RWA legal counsel. Conversations underway.

Vision

We're not building for crypto natives.
We're rebuilding capital markets.
